About us, Ace Alzheimer Center Barcelona

Home | making Alzheimer's history > Mission, vision and values

The foundation: Mission, vision & values

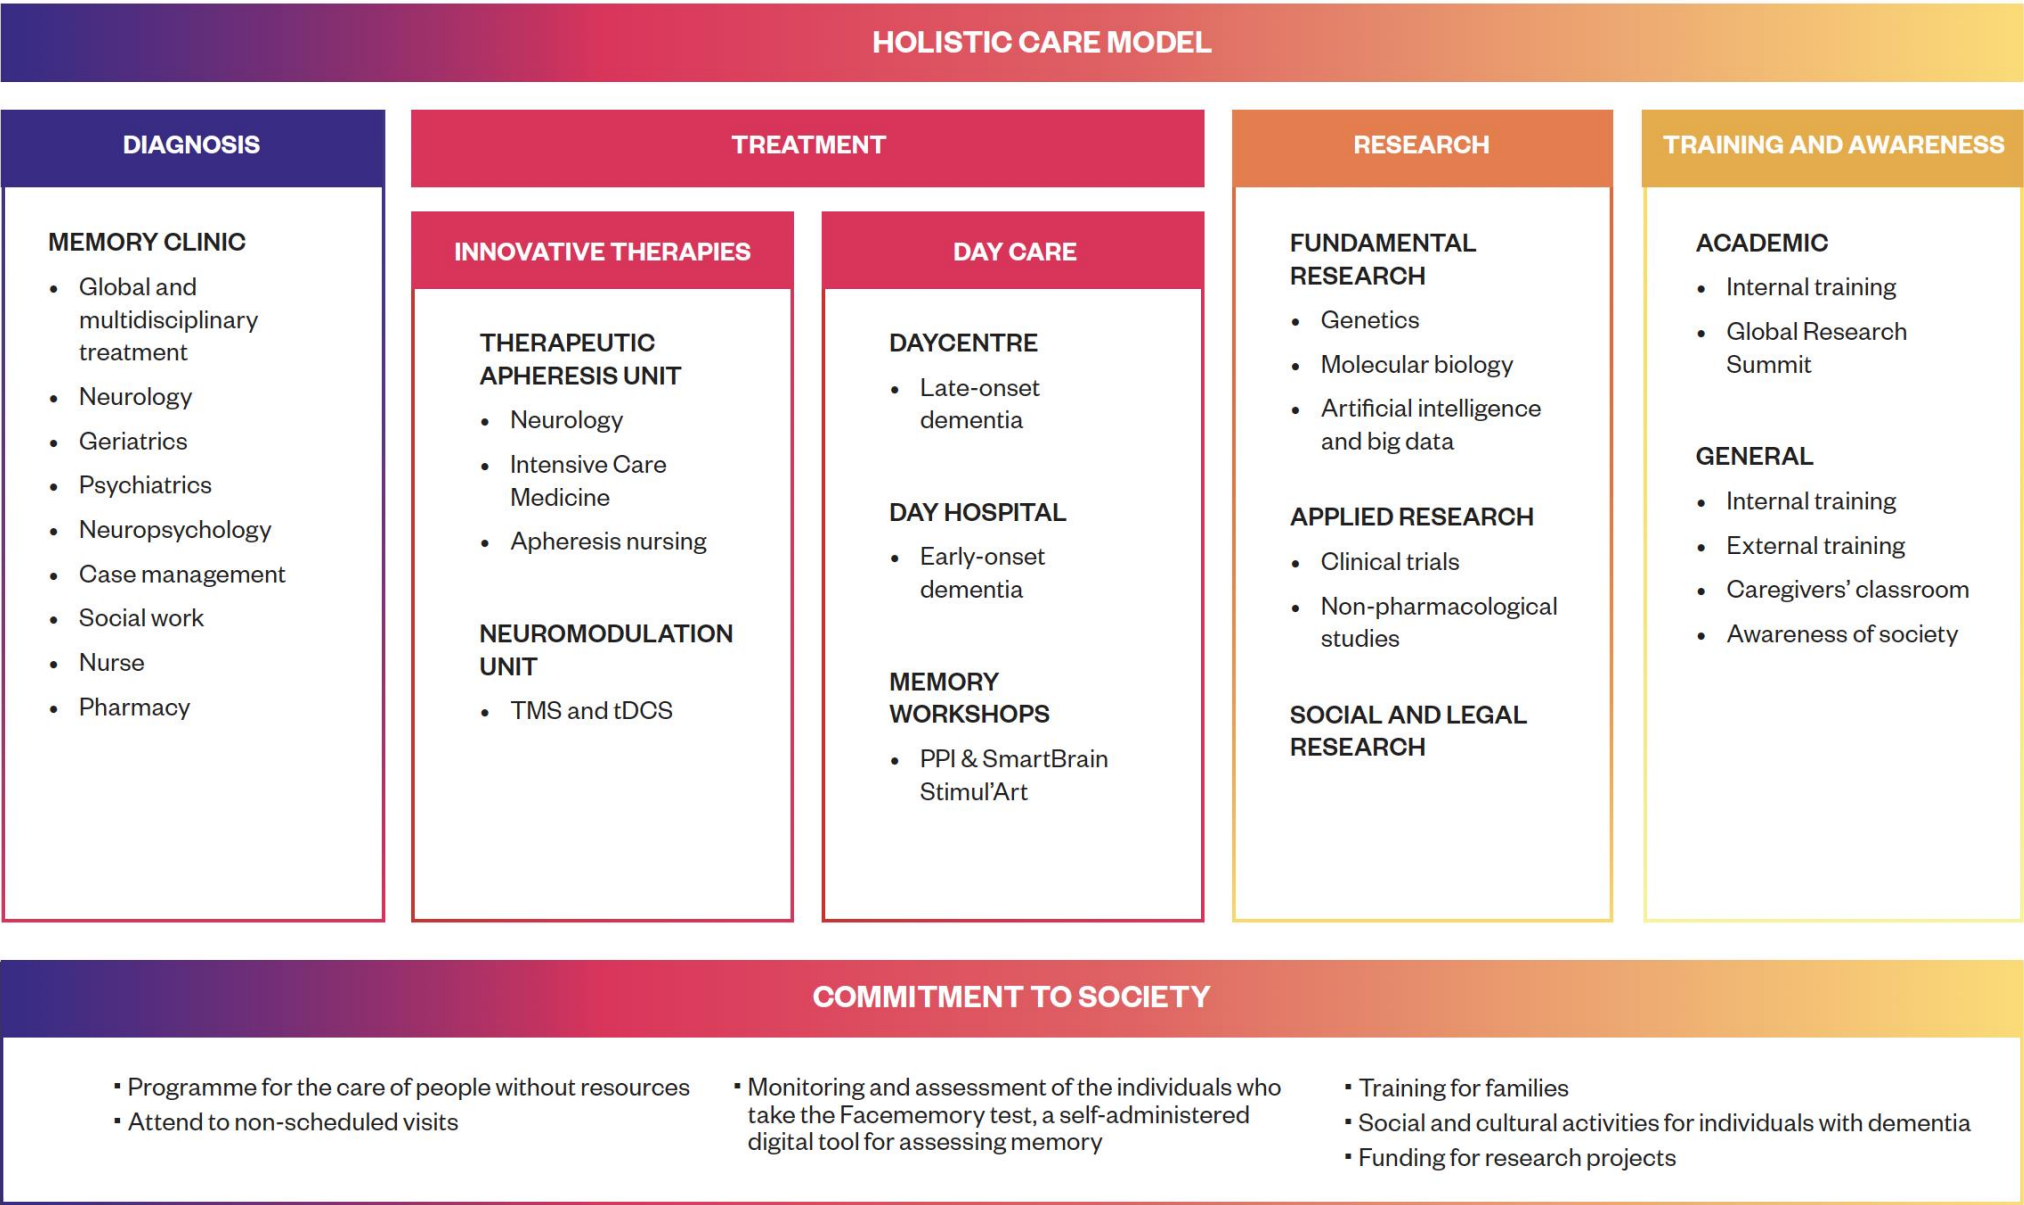

Mission

Ace Alzheimer Center Barcelona is a non-profit entity at the service of people with Alzheimer's disease or other dementias, and their caregivers. To do so, we carry out actions in the fields of diagnosis, treatment, research, training and awareness.

Vision

At Ace Alzheimer Center Barcelona we work to make someday Alzheimer's history.

Projects ongoing: CSLP

Scientific Relevance of Computerized Spontaneous Language Processing (CSLP) in MCI and Dementia Research

Aspect	Description
 Digital Biomarker	CSLP provides objective, quantifiable data on language use, which reflects underlying cognitive functions.
 Early Detection	Subtle changes in language (fluency, structure, prosody) can be detected before clinical symptoms of dementia appear.
 Monitoring Progression	Enables longitudinal tracking of cognitive decline through repeated, non-invasive assessments.
 Remote Usability	CSLP can be integrated into home-based or telehealth platforms for large-scale or continuous monitoring.
 Integration with Other Biomarkers	Enhances diagnostic accuracy when combined with neuroimaging, fluid biomarkers, or cognitive testing.
 Multidimensional Analysis	Allows both linguistic (lexical, syntactic, semantic) and acoustic (prosody, pauses, pitch) features to be extracted and <u>analyzed</u> via AI tools.

PuntoClinic

Manage and monitor

Speech-based digital biomarker for cognitive assessment to facilitate and improve remote monitoring of disease progression and early detection.

Remote pre-screening

Select patients for clinical trials and new treatments.

PuntoCare

Smartphone/tablet app that offers daily support to people with cognitive impairment and their families

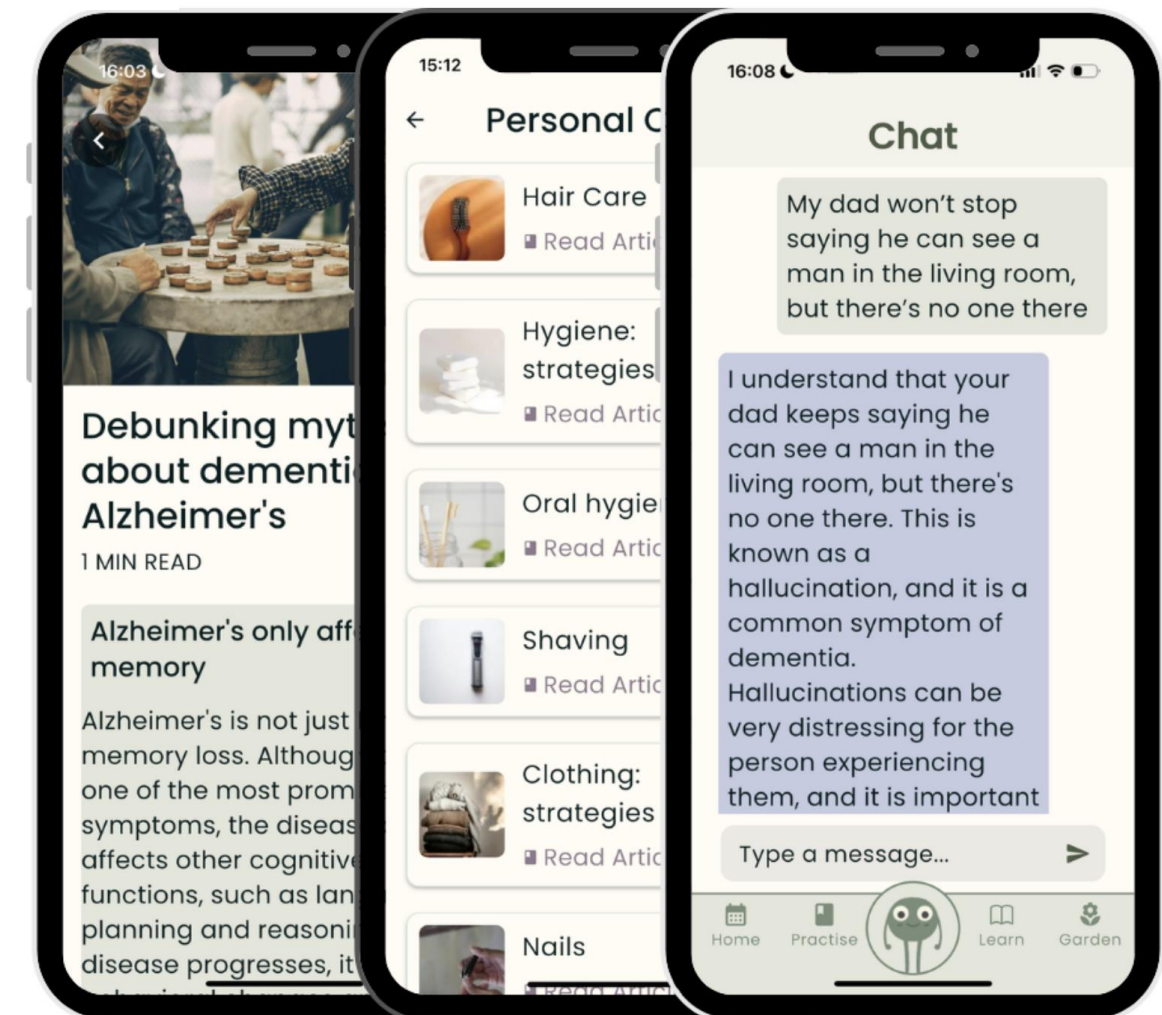

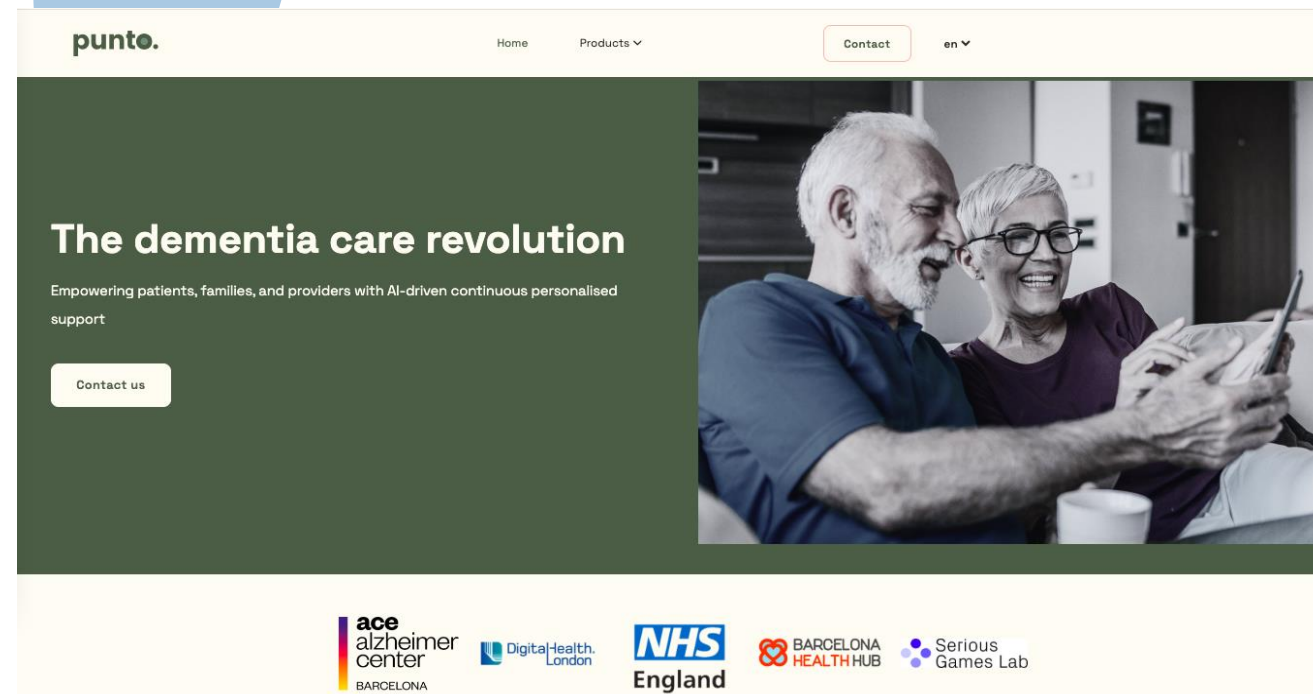

- Personalised daily care plans: cognitive stimulation exercises, physical activity, healthy habits, relaxation, etc.
- Articles providing clinically validated information curated by experts

Management

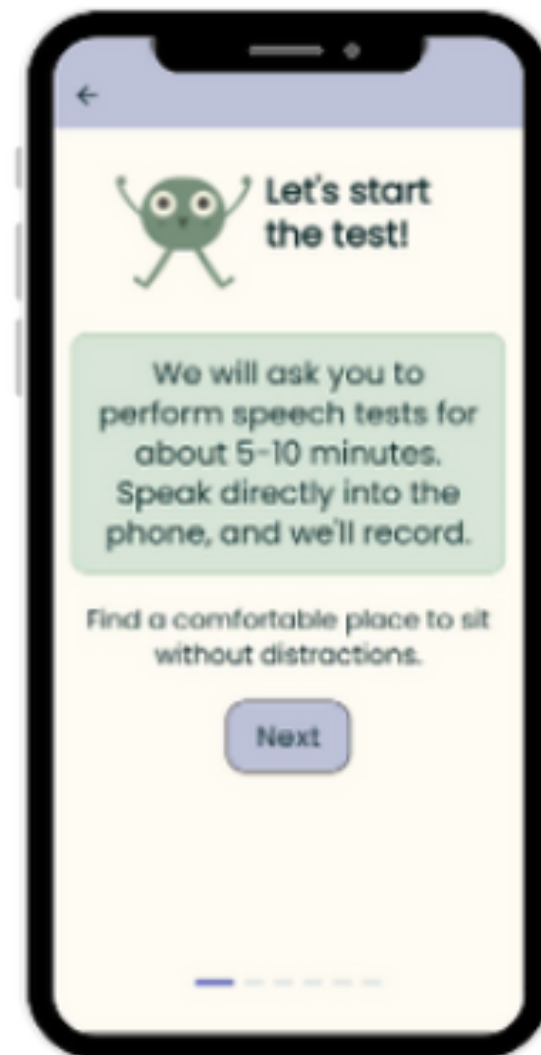

- AI assistant that interacts with content and provides answers, tips and strategies when you need them
- Symptom diary that facilitates monitoring and management

Projects ongoing: Pharmacies and cognitive impairment

OBJECTIVES

- Detect subtle cognitive alterations in advance of those evident on traditional clinical assessments.
- Optimize clinical referral to specialized units when markers of risk are detected.

DEPLOYMENT

Digital Screening in Pharmacies

Citizens who visit participating pharmacies invited to take part voluntarily

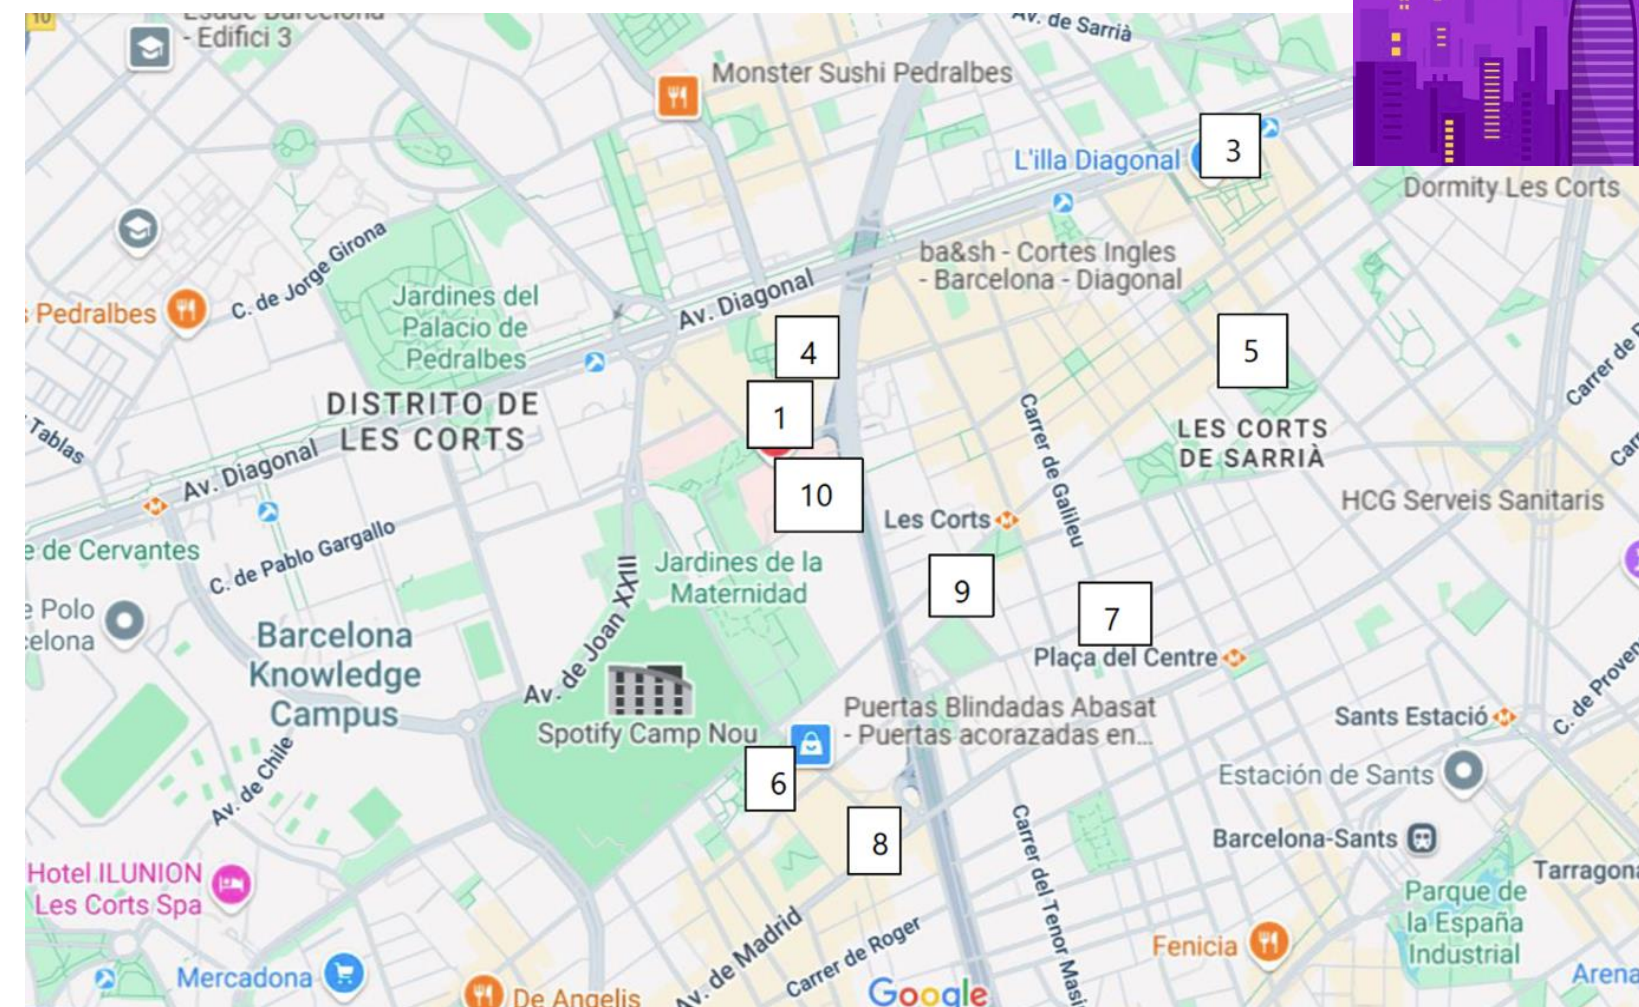

Screening Procedure

Consists of e-consent, basic demographic data collection, and language evaluation with AI analytics

Follow-Up

Results communicated to participants by phone or email, with referral offered if needed

Projects ongoing: Pharmacies and cognitive impairment

Projects projected : Menopause and cognitive impairment

🌸 *Cognition and Memory Problems during Menopause*

Aspect	Description
🔄 Hormonal Changes	Decline in estrogen affects neurotransmitters like acetylcholine, linked to memory and attention.
🧠 Subjective Cognitive Decline	Many women report "brain fog," forgetfulness, or difficulty concentrating during perimenopause.
🔬 Neurobiological Correlates	Brain imaging shows changes in hippocampal activity and connectivity during menopause transition.
📉 Impact on Daily Function	Memory lapses and reduced focus can affect professional and personal functioning.
💡 Differentiation from MCI	Menopausal cognitive symptoms may mimic early MCI but are often reversible or fluctuate with time.

Fostering Personalized solutions for prevention of dementia and frailty

Better Health, Smarter Care

Certified Digital Solution for Patients & Providers

Healthentia is an EU-certified Software as Medical Device (SaMD) designed to support healthcare providers in monitoring patient health, tracking real-world data, and delivering personalized virtual coaching. Our solution enables clinics, hospitals, and researchers to diagnose, prevent, monitor, predict or prognose diseases.

Speech-based biomarkers for Alzheimer's disease offer several exciting possibilities:

WHAT IF SPEECH COULD
UNLOCK EARLY DETECTION OF
ALZHEIMER'S DISEASE?

In the early stages, Alzheimer's symptoms can be subtle and mistaken for normal age-related cognitive changes. While many people and their families may not recognize the signs as indicative of a serious cognitive disorder, early diagnosis can result in better quality of life and more effective treatment for those with

Home | making Alzheimer's history > Check your memory online for free with FACEMEMORY*

Get your free memory assessment

Facememory has to be done by **tablet or PC**.

ENTER THE FACEMEMORY* TEST

You are about to start Facememory *, the first online test for memory assessment. This test has been designed by an expert team in cognition, with more than 25 years of experience in the memory tests of people over 50 years old. Ace Alzheimer Center Barcelona, a leading non-profit organization in Spain, was founded in 1995 with the aim of meeting the growing demand in the diagnosis and treatment of people with cognitive impairment and dementia, especially Alzheimer's disease. With a multidisciplinary team of more than 85 people, we offer personalized attention and comprehensive support to patients and their families. Currently, we are an international benchmark in diagnosis and research, especially in clinical, neuropsychological, social and basic research.

Each year, the Ace Alzheimer Center's Diagnostic Unit cares for about 7,000 people, of which more than 4,000 suffer from dementia (3,000 of them, Alzheimer's type). Among other research activities, we participate in numerous global participatory clinical trials targeting all stages of the disease course.

The neuropsychology team at Ace Alzheimer Center Barcelona, which will be in charge of reviewing and evaluating the results of this test, has successfully reviewed the memory of more than 3,000 people with a test similar to this one.

(some few) Key Messages

1. Digitalization Extends Our Reach

Leveraging digital platforms allows us to assess cognitive risk *beyond the clinical setting*, bringing early detection directly to the communities where people live.

2. Towards Early, Accessible Cognitive Screening

We are redefining early detection through remote, user-friendly assessments—empowering individuals to seek support before symptoms become disabling.

3. From Patients to Populations

Our model scales: we move from one-on-one evaluation to population-level screening, making cognitive care more **preventive, proactive, and inclusive**.

4. A Synergy Between Clinical Expertise and Technology

Partnership with merges validated clinical protocols with digital design, ensuring that innovation is always aligned with care quality and scientific rigour.

5. Research-Driven and Scalable

Our model is embedded in a framework of clinical research and continuous improvement—**ready to scale** and adaptable to different health systems and populations.
